ntainer closure formed from  
nit has a circular top panel  
l extending downwardly from  
nel wall. An outer cylindric  
indrical sealing protrusion  
anged therebetween, all hav  
a predetermined size, are  
f the top panel wall. The th  
f the top panel wall is reduc  
a plurality of ribs having  
are formed on the inner su  
f the top panel wall.

A container closure formed from a synthetic resin as a single unit has a circular top panel wall and a cylindrical skirt wall extending downwardly from the peripheral edge of the top panel wall. An outer cylindrical sealing protrusion, inner cylindrical sealing protrusion and annular sealing ridge arranged therebetween, all having a predetermined shape and a predetermined size, are formed on the inner surface of the top panel wall. The thickness of the center portion of the top panel wall is reduced to a predetermined range and a plurality of ribs having a predetermined thickness are formed on the inner surface of the center portion of the top panel wall.
